

Really Eatable Food

This is Vereatable's goal. Allow people to eat healthy plants, vegetable and fruits that are really biological, grown without pesticides. No need to trust the market anymore or to buy expensive food.

Indoor Garden

Growing your plants at home needs some space! If that's the problem our product will solve it because it's vertical. Even urban people could educate their children about nature and how to grow plants respectfully to the environment.

Simple to Use

You do not need to control the water or the light. You only need to plug it, select the plants on your smartphone app and refill the water compartment when needed.

Totally Autonomous

After selecting the plant you have added to your pot, our database will find all the needs this plant requires to grow in a good way. The sensors regulate the lights and the water requirements autonomously.

VEREATABLE
Indoor Garden

Low Energy Consumption

The LED lights are controlled by a sensor which turns on only when your plants require it. The water is controlled by Aeroponic system.

This is the process of growing plants in an air or mist environment without the use of soil.

That means the water is directly sparked on the roots so there is no water waste.

Briefly even if it's plugged to electricity, Vereatable respects the environment - it uses less water than soil gardens and nowadays electricity is a renewable energy.

Smartphone Connected

Having a busy life does not make much room to grow your own plants and keeping up with a healthy lifestyle ! That's why Vereatable is connected to a mobile app.

This way you can check on which day your plants will be ready to eat, switch easily from one plant to an other and the system will change all the requirements of your new plant.

Thanks to the database shared with Vereatable's users you are able to grow your plants like a pro and share your experiences and all the requirements your plants need depending on your location.
